

PROJECT TITLE – THE CAMPUS PLACEMENT PORTAL

FACULTY – PROF. M. BRAVEEN

COURSE CODE - D2

COURSE TITLE – DATABASE SYSTEMS

TEAM MEMBERS : SHASHWAT SIDDHANT { 25BCE5227 }, ARNAV SEMWAL { 25BCE5392 }

Project Description

Campus Placement Portal is a centralized database management system designed to simplify and automate the campus recruitment process for educational institutions. The system serves as a bridge between students, companies, and the Training & Placement (T&P) cell by storing and managing all placement-related information in a single platform.

Students can create and maintain their profiles by providing details such as Roll Number, Name, Department, and CGPA. Recruiters can register their companies, provide contact information, and post job opportunities with eligibility criteria, salary packages, and job descriptions. Students can then apply for suitable job openings, while the system records every application and continuously tracks its status, such as **Pending, Shortlisted, Rejected, or Hired**.

The portal replaces traditional spreadsheet-based record management with a structured relational database, ensuring better organization, data consistency, and faster access to information. It establishes clear relationships between students, companies, job postings, and applications, making it an ideal implementation of database concepts such as entity relationships, normalization, and SQL operations.

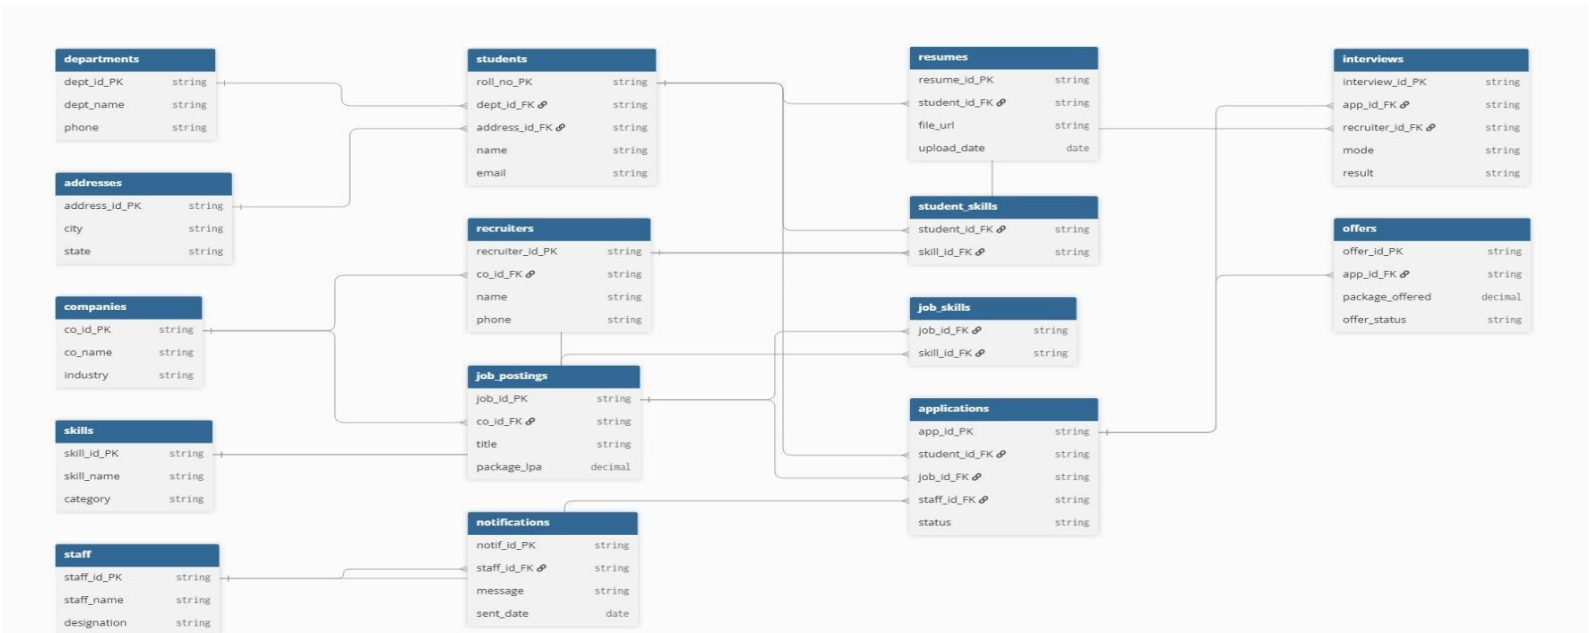

Overall, the Campus Placement Portal improves efficiency, reduces manual work, minimizes data redundancy, and provides a reliable, scalable, and transparent solution for managing campus recruitment activities.

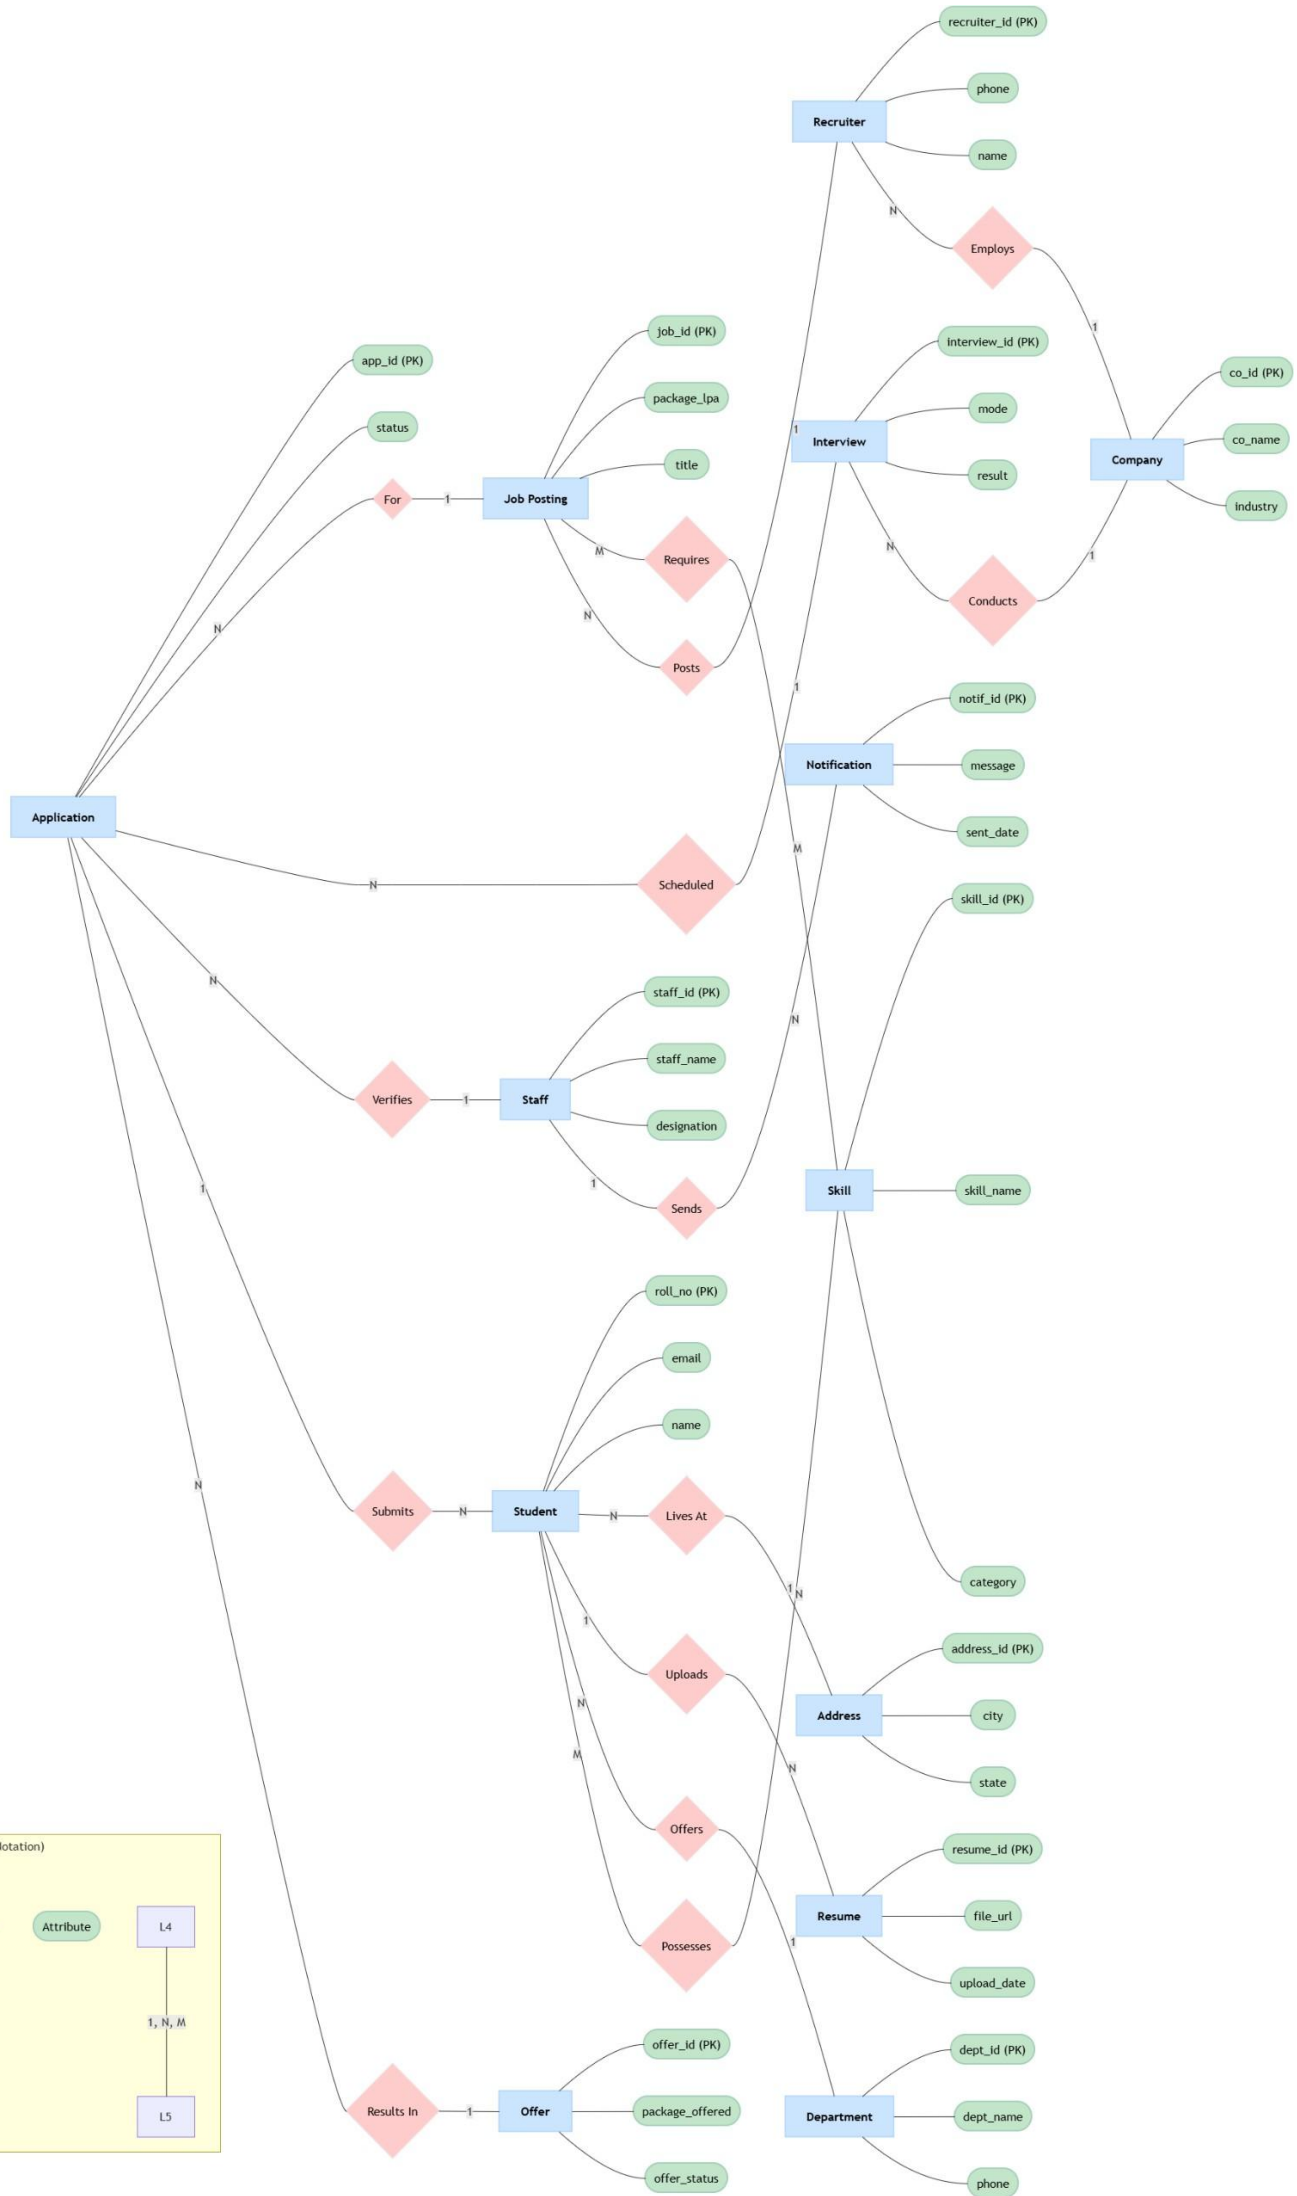

Short Description (2–3 Lines)

The **Campus Placement Portal** is a centralized database system that automates the campus recruitment process by connecting students, recruiters, and the Training & Placement cell. It manages student profiles, company registrations, job postings, and application tracking in a structured and efficient manner while reducing manual record management.

Objective

The primary objective of this project is to develop a centralized placement management system that streamlines the recruitment process, reduces manual effort, eliminates data redundancy, and enables efficient management of students, companies, job postings, and placement applications through a well-designed relational database.
